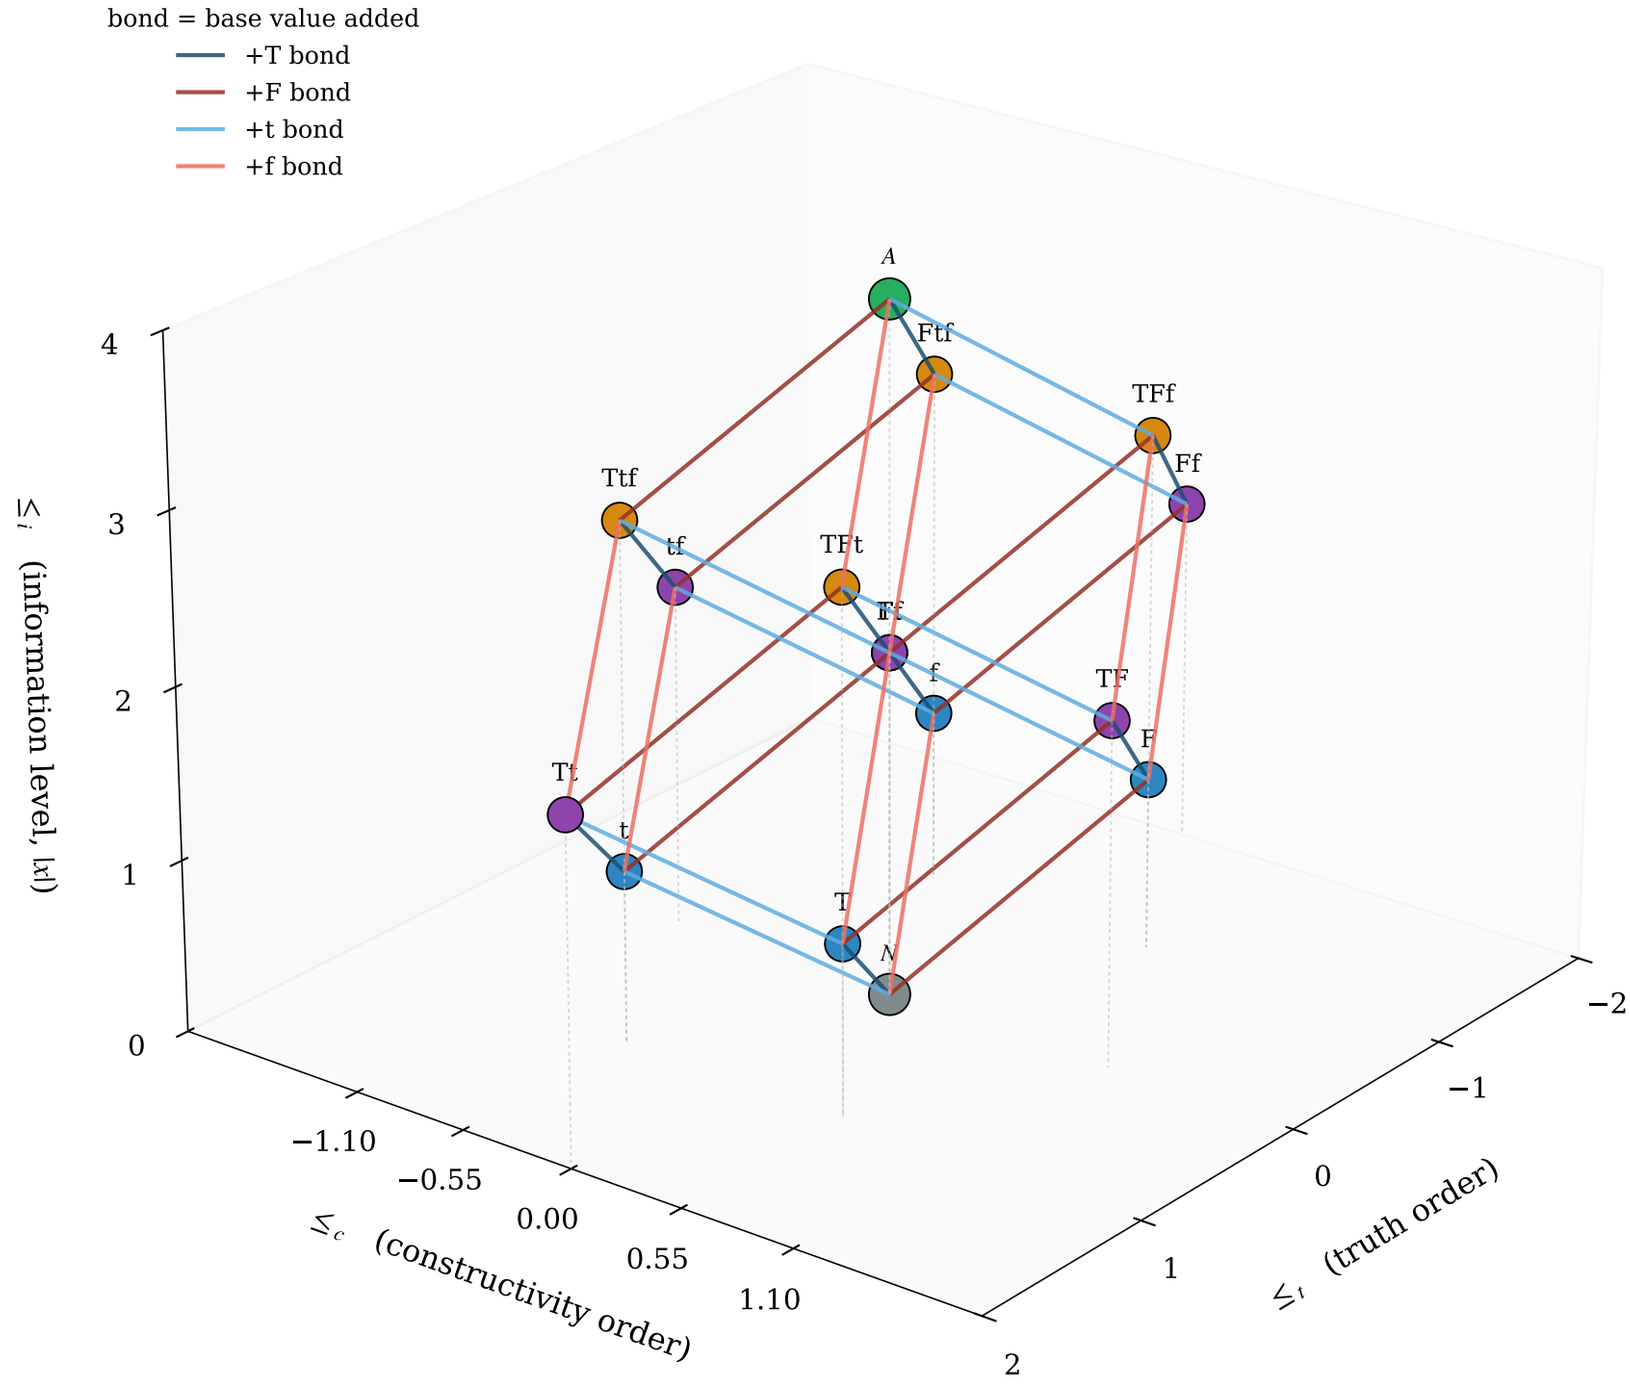
SIXTEEN$_3$ — the trilattice of constructive truth values
$P(\{T,F,t,f\})$, three independent orderings, rendered as a crystal



$N = \varnothing$ (no information) $\rightarrow$ $A = \{T,F,t,f\}$ (full information). Vertical axis is the literal subset order (Def. 5.2, Shramko–Dunn–Takenaka 2001); the two horizontal axes are the truth- and constructivity-order projections of the same 16-element carrier. Edges are the covering relation of B_4 — 32 bonds, 4 directions, one per base value.
